

## Diabetes

Diabetes is a disease that currently affects... 366 million people worldwide.

In 2030, this number will increase to about half a billion patients.

Whether hereditary or acquired, diabetes is a chronic disease,

Which means it lasts a lifetime. Often favored by a sedentary lifestyle and a diet that is too rich, Its explosion is due to changing lifestyles, to urbanization in emerging countries

Sanofi has therefore made diabetes a priority: in research, also in access to treatment, and when it comes to Patients care.

Incidentally one of Sanofi's insulins is the most widely distributed in the world.

We also want to accompany patients by offering medical devices that improve their daily life.

But above all, we want to prevent this disease, which can lead to severe complications...

Therefore, in Asia or Central America, for example, Sanofi sets up health education programs and health care centers.

Because diabetes is a public health priority, and because Sanofi's expertise should be available to everyone.
